## Engine Heat Balance

A heat balance sheet is an account of heat supplied and heat utilized in various ways in the system. Necessary information concerning the performance of the engine is obtained from the heat balance. The performance of an engine is generally given by a heat balance sheet. To draw a heat balance sheet for the I.C. engine, it is run at constant load and constant speed.

THEORY: To balance the energy input and output what is done usually is to add all the known forms of energy output in heat units and, the difference between this and the given energy input is termed as unaccounted losses (lost by radiation etc). Thus law of conversion of energy is kept unaltered. 1.

It plays a critical role in sustaining engine heat balance by removing heat. In a heavy-duty diesel engine, only one-third of the total energy produced works to propel the vehicle forward. An additional one-third is removed as heat energy by the exhaust system. The remaining one-third of heat energy produced is taken away by the engine coolant.
