Liposomes In Gene Delivery

Liposomes are often used to deliver a molecular cargo such as DNA for therapeutic benefit. The lipids used to form such lipoplexes can be cationic, anionic, neutral, or a mixture thereof. Herein physical packing parameters and specific lipids used for gene delivery will be discussed, with lipids classified according to overall charge.

Liposomes composed of DOPE/OA/chol are capable of transfecting mouse Ltk-cells (cells lacking thymidine kinase (TK)) with an exogenous TK gene (9). In this study, pH-sensitive liposomes were 8-fold more efficient in gene delivery than pH-insensitive liposomes.

Liposomal-Based Therapeutic Carriers for Vaccine and Gene ...

Cationic liposomes (CLs) are composed of phospholipid bilayers. One of the most important applications of these particles is in drug and gene delivery. However, using CLs to deliver therapeutic nucleic acids and drugs to target organs has some problems, including low transfection efficiency in vivo.

Preparation, characterization, and efficient transfection ...

The use of liposomes for transformation or transfection of DNA into a host cell is known as lipofection. In addition to gene and drug delivery applications, liposomes can be used as carriers for the delivery of dyes to textiles, pesticides to plants, enzymes and nutritional supplements to foods, and cosmetics to

Liposome - Wikipedia

First-generation liposomes in gene delivery suffered from several limitations such as poor encapsulation efficiency, poor release, and lower in vivo targetibility. Among second-generation liposomes, cationic liposomes have found better efficiency and good targeting ability for DNA delivery as compared with conventional liposomes.

Liposomes in Gene Delivery | Taylor & Francis Group

- Liposomes are artificial phospholipid vesicles used for the delivery.
- They can be preloaded with DNA by two common methods- membranemembranefusion and endocytosis thus forming DNA- liposome complex.
- This complex fuses with the cell membrane of target cell and to release the contents into the cell.

The success of liposome-mediated gene delivery is a multifactorial issue and well-designed liposomal systems might lead to optimized gene transfection especially in vivo. To date, liposomes with different characters have been applied as drug carriers, such as PEG-bearing liposomes, charged liposomes, stimuli-responsive liposomes. Fig 2.
