Physical Properties Of Dental Materials

Some objects feel strong and hard; others feel weak and flexible. Engineers have devised a variety of laboratory tests to quantify the properties of materials. Dental materials scientists use the same tests (as well as several others) to describe the physical properties of materials used in dentistry.

i) ELECTRICAL PROPERTIES Dental materials used intra orally do not need to be a conductor of electricity, those conducts, requires the use of preventive measures to insulate them from the pulp. It is possible to generate electrical currents and voltages by conducting of two metals of dissimilar compositions, this phenomenon is called GALVANISM.

General Properties of Dental Materials All materials have physical properties like color, weight, solubility, thermal conductivity, and others, also mechanical properties like hardness or softness, strength or weakness. There is no material till now has ideal physical or mechanical properties.

General Properties of Dental Materials

Dental restorative materials are used to replace tooth structure loss, usually due to dental caries (dental cavities), but also tooth wear and dental trauma. On other occasions, such materials may be used for cosmetic purposes to alter the appearance of an individual's teeth.. There are many challenges for the physical properties of the ideal dental restorative material.

Dental material - Wikipedia

Among the usual dental materials, ceramics exhibit the lowest adhesive capability due to their inert surface. Based on various papers, zirconia dental ceramics, for instance, manifest lower adherence than metals, or even natural teeth. Some of the most common dental materials and the characteristics of the formed biofilm are presented in Table 7.2.
